STAR WOLF

ART SPEC

CONCEPT

In Star Wolf, you are in command of a starship. You go to sectors of space, where you will hunt down and destroy the Enemy Flagship.

The game is a top-down 2D real-time, tactical, space combat experience. The novelty of the game is that it is played entirely through a control panel interface. Apart from very select money shot moments, there is no 3D visual of the outside.

Starship captain interact with the world through various ship systems which include navigation, weapons, troops, sensors, and signals intelligence.

ART STYLE

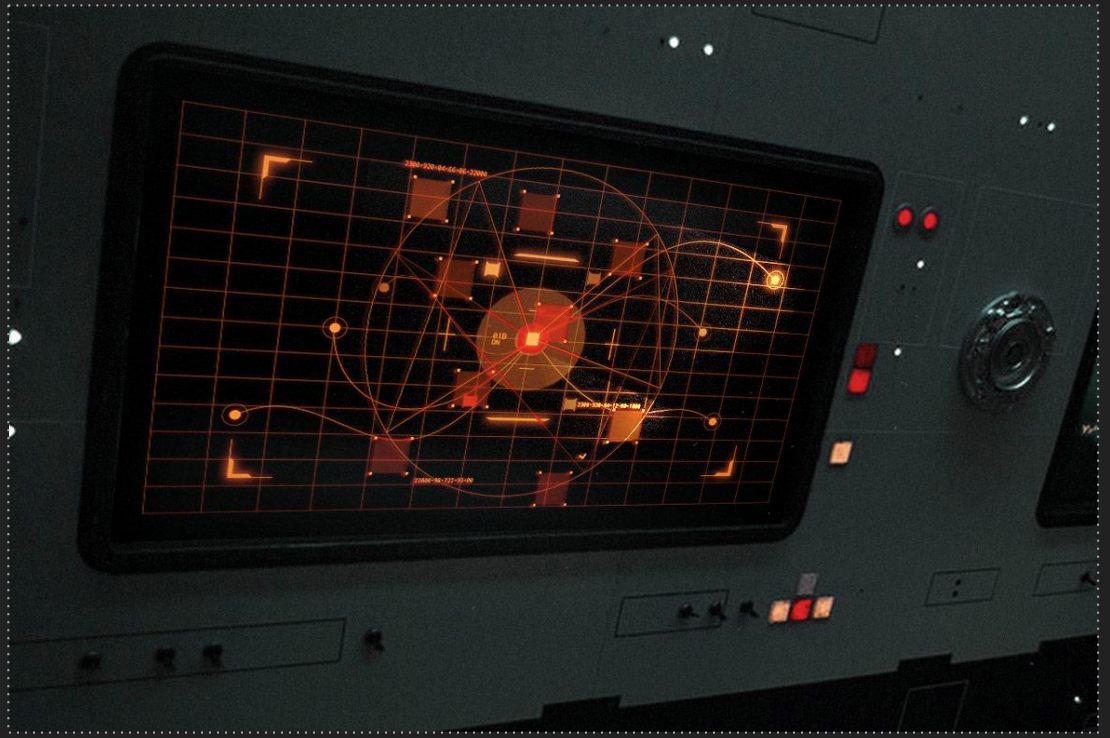

Drawing inspiration from science fiction book covers of the 70's and 80's, Star Wolf's goal is to set itself apart visually from the plethora of space games while preserving the cool edginess this style

Star Wolf Art Direction Pillars;

1. **Retro-Futurism Advanced:** Blending the distinct look of retro sci-fi with the grounded coolness of contemporary technology.

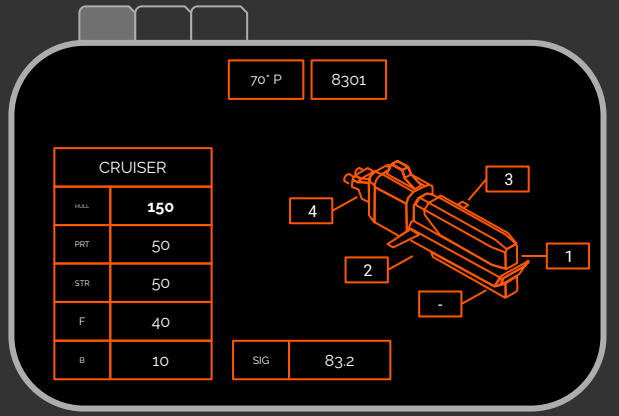

2. **Realistic & Abstract:** A realistic minimalistic terminal driven experience that sets us apart from the hyper-realistic 3D look most sci-fi games aim for.

3. **Visual Variety:** Wide range of player ships, assortment of enemy units and an assortment of environments that speak to the vastness of space, and add depth and personality to the world on the console

Monochrome, military style layout.
The UI screens are a single colour against black, geometric shapes.
We're going for a slightly retro look so each screen will be set into some kind of metal frame.

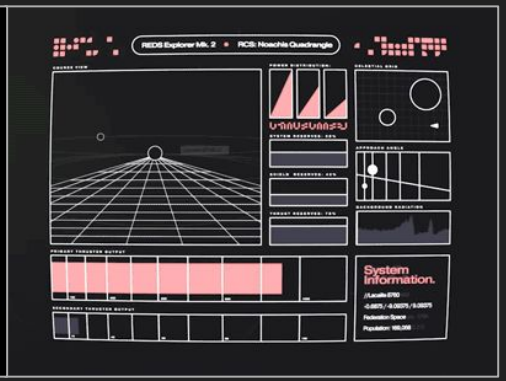

There will be lights and switches.

Ship Design

The *Star Wolf* is a wedge-shaped stealth destroyer, designed with a retro-futurist military aesthetic. The wireframe design should emphasise sharp angles, mass, and silhouette clarity. Thematic, we are going for **brutal**, **enduring**, **rugged**, **inexorable**.

- Wedge-shaped wings with a broad, blunt profile. The neck hosts broadside guns like a sailing ships cannons.
- Hammerhead prow, wide and flat. Strong frontal presence. Looks like a ramming or sensor array section.
- Triangular aft structure enclosing the main thrusters. Compact and well-protected.
- Dorsal command tower sits slightly behind the centre, angled forward like a submarine conning tower. Short, sharp, angular.
- Imagine a **Sword** silhouette from top-down view - triangular blade with midline symmetry, longer necks on larger ships. More ridges to denote size.
- Hull structure is layered and angular. Avoid curves. Emphasise panel seams, plating, and embedded turret mounts.
- Avoid ornamental or fragile-looking elements. Prioritise strong, readable shapes that communicate function and survivability.

Ship Design

These are hi-res references of the design language of the starships in game, The 3d models in game will be incredibly low-poly with largely the primary shapes blocked out. We won't be applying a texture to it.
The ship has no windows. It's functional and utilitarian with hard edges.
If you disregard the engine wedges, the shape is that of long and broad sword. In this example, an executioner's sword, which is designed to have a blunted tip. But the metaphor is quite good and I believe this conveys a sense of seriousness and threat.

The gun would come out the "neck" of the ship, not the wings. The railgun would run down the centre line, and missiles would probably be embedded in the flanks. In 3d, the ship would have a small tower (like a submarine)

Ship Design

Story Context

So who are your enemies and why do all the ships seem similar?

In the game, you are fighting your own side; enemies who were once your allies,

So all military ships follow the same aesthetic and design language.

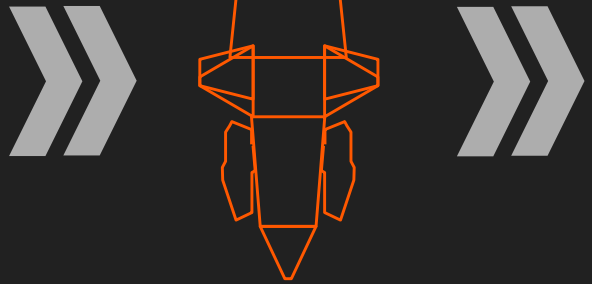

Ships will vary in length and width according to their class and category, but they are all built on the same principals.

Ship Design - In Game

The ship in-game would like the following in the top-down visual screen.
The need for 3D is more so to pose ships on the scanner in different angles as well create moments of Star Wars like money shoots (grainy footage etc)

Sample of Star Wolf

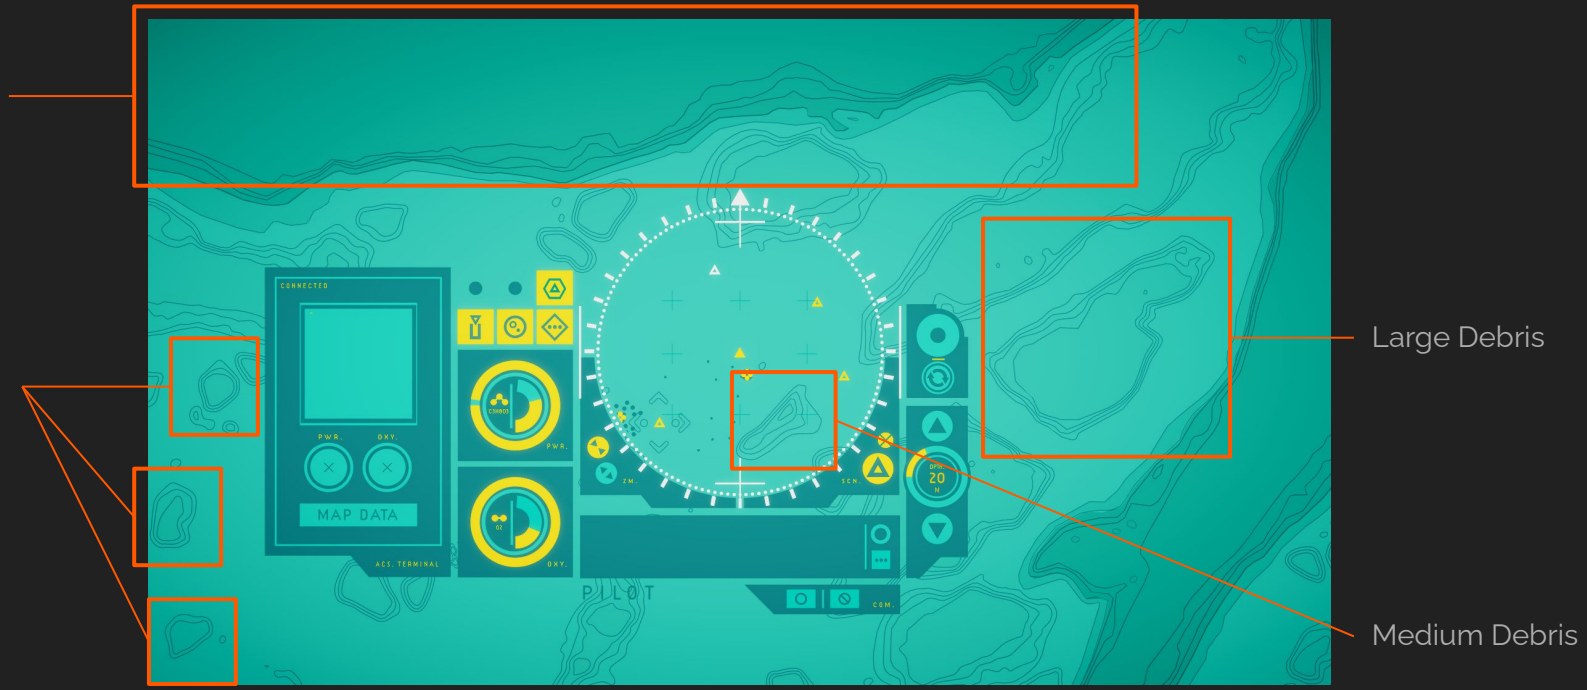

Ref for output

Obstacle Design - In Game

The world has 2 kinds of obstacles - rocks (which appear as more flowing or curved shapes, and metal pieces debris of destroyed spaceships and starbases etc. These are are just angular more angular.

Objects are different sizes don't vary too much in broad shape; In the example image, the shapes are basically just scaled up and the super dark and giant ones form boundaries and barriers, adding shape to the level.

Art Req

1. Ship 3D

Type	Unit Length
Frigate	1
Corvette	3
Destroyer	5
Cruiser	7.5
Grand Cruiser	10
Battleship	12
Dreadnought	25

These lengths are there to give us a sense of the proportion and size of ships in relation to each other.

The idea is that a destroyer (you) will often be fighting ships which are much larger and powerful than you, and the size of that should reflect on the screen.

So a Dreadnought will be 5 times the size of a Destroyer, requiring you to think carefully before you attack it.

2. Obstacles

Natural

2.1. Small Asteroids
2.2. Medium Asteroids
2.3. Large Asteroids
2.4. Giant Asteroids

Mechanical

2.5. Small Debris
2.6. Medium Debris
2.7. Large Debris

2.8. Showpiece (Giant Mechanical)
